

THEMATIC GROWTH RESEARCH

Equity Research

Structured thematic equity research – rubric, valuation models, and adversarial review, packaged for offline reading.

Report generated: 12 May 2026

Contents

1. Equity Research
2. Discover – goals and theme weights
3. Industry trends – macro & sleeves
4. Screen & shortlist
5. Research – adversarial reviews
6. Valuation & risk models
7. Decide – model reconciliation
8. Monitor
9. Appendix
10. Stock deep-dive

Digital PDF: use bookmarks or tap a line above. Interactive HTML keeps filters and live charts.

Equity Research

Structured thematic equity research – rubric, valuation models, and adversarial review. Same scope as the PDF cover: from universe screen through valuation and decide.

What this pack covers. The dashboard scores a growth-oriented universe on a consistent rubric, runs multiple valuation models, stress-tests each thesis, and surfaces names for deeper work. Sections follow one pipeline: **Discover** (goals and weights), **Screen** (universe and shortlist), **Research** (adversarial reviews), **Value** (scenarios, DCF, risk metrics, Monte Carlo), **Decide** (reconciliation), then **Monitor** in the live HTML (charts, watchlist, triggers – screen-only in the PDF export).

How names are scored. Each company is scored 1-5 on six dimensions – growth, margins, balance sheet, durability, tail risks (higher is worse), and valuation (higher means cheaper). Scores combine into a composite out of 30 with equal weights and transparent qualitative criteria – no hidden weighting or black-box scoring.

Evidence and models. Fundamentals and history come primarily from **yfinance** (verify material numbers in **SEC filings** and company releases). Valuation layers include forward-multiple scenarios, DCF sensitivity grids, historical risk metrics, and Monte Carlo paths. The live HTML adds filters, sorting, **TradingView** charts, and directional social inputs from Reddit and X – not trading signals. AI assists theme research, earnings cross-checks, adversarial review, and sentiment scanning; every buy/sell/hold decision stays with you.

Using this PDF vs. the dashboard. The export is an offline reading pack (conclusions, evidence, model outputs). Expandable sections are inlined for print – layout is tuned for paper, not pixel-perfect parity with the screen. Treat cross-model disagreement as a **filings and guidance checklist**, not noise.

Report generated **12 May 2026**. Underlying figures as of **2026-05-11 UTC** unless noted in-body. This material is **education and research**, not personalised investment advice. yfinance fields can be delayed or mis-mapped; verify in filings before acting.

Disclaimer: No recommendation to buy or sell. No guarantee of returns. UK and other readers must confirm broker, ISA or SIPP eligibility, and tax treatment before trading.

Discover

Investor goals, risk appetite, and the investment universe

You are building a growth portfolio across six structural themes, spanning US, UK, and European markets. Each theme gets a target weight based on conviction and opportunity size. The approach is to drip-buy gradually – many small positions over time rather than deploying all at once. The universe includes NYSE, NASDAQ, London Stock Exchange, Euronext, and Xetra-listed names – all accessible to UK-based investors through major brokers. The table below shows how capital is distributed across themes.

Target theme weights

Theme	In simple words	Target %
AI infrastructure & compute	Chips, servers, data centres, and gear that run AI	30%
Energy transition & grids	Power, grids, and equipment as electricity demand grows	28%
Health Tech	Tech-driven healthcare: robotic surgery, AI diagnostics, biotech pipelines	15%
Industrial automation & robotics	Factories and robots doing more of the work	12%
Cybersecurity & digital trust	Blocking hacks and keeping data and systems safe	10%
Quantum / frontier compute	Very early "next" computers—not yet a big business for most names	5%
Total		100%

Universe coverage: 157 companies across 6 themes on US, UK, and European exchanges, screened for direct thematic linkage to the demand driver – not just "AI" in the pitch deck.

Industry Trends

The macro, sector, and thematic forces shaping where opportunities exist

Three forces drive every theme below: the AI capital expenditure cycle pulling demand for chips, power, and security; grid modernisation and electrification reshaping energy markets; and regulatory tailwinds (IRA, CHIPS Act, NIST cybersecurity frameworks) creating policy floors under spending. Each theme card explains the demand drivers, where value accrues, and common mistakes to avoid.

Industry & macro narrative

Theme	Thesis in one breath	Where value tends to accrue	Common mistake
AI infra (30%)	Training, inference, and enterprise copilots need accelerators, HBM, networking, cooling, and power inside hyperscale data centres; cloud capex is the demand flywheel.	GPUs/accelerators, memory, EDA, WFE (deposition/etch/metrology), DC networking, thermal/power subsystems – each layer has different cyclicity and customer concentration.	Labelling any software “AI” without revenue tied to physical or design infrastructure that enables compute.
Energy & grids (28%)	AI load plus electrification raises baseload and peak needs; regulated wires, merchant IPPs, renewables, and grid hardware all play different roles in the same macro story.	Allowed ROE utilities, contracted PPAs, grid equipment backlogs, select solar/midstream – map who earns regulated vs merchant vs manufacturing margin.	Equating long-run load growth with next-quarter power prices (weather, gas, policy noise).
Cyber (10%)	More cloud + AI surface area raises breach risk; boards standardise on platforms, identity, and OT protection – renewals and module attach drive durable spend.	Consolidating platforms, network appliances with installed base, SASE/identity specialists – compare net retention and module cross-sell, not logo counts.	Treating all “cyber” as one factor; growth and retention dispersion across peers is wide.
Industrial auto (12%)	Labour shortages, reshoring, and precision requirements push capex into robots, motion, sensors, and industrial software – but cycles bite when factories pause spend.	Factory automation vendors, power management for plants and DCs, integrators with recurring service – check backlog quality vs one-off equipment.	Confusing strong order headlines with durable profit when customers can cancel or defer capex quickly.
Health Tech (15%)	Technology shifts outcomes (GLP-1, robotics, devices, targeted oncology); payers and patent clocks determine economics as much as clinical efficacy.	Transformative franchises with runway, robotic platforms with consumables, select devices – diligence payer coverage and patent cliffs.	Ignoring who pays; great science can still fail commercially if reimbursement tightens.
Quantum (5%)	Early-stage hardware, cryogenics, and cloud access bets; useful commercial advantage vs classical compute is still uneven; dilution and milestone risk dominate.	Hardware paths, control electronics, enterprise hybrids (e.g. IBM) – read cash runway and revenue quality in filings.	Confusing lab milestones with near-term per-share cash flows.
Space & defence	Cross-cutting sleeve: launch cadence, satellite services, defence primes – long programmes, political risk, dilution for growth-stage space.	Backlog visibility, services mix, execution on programmes vs hardware one-offs.	Ignoring dilution and programme slips while focusing only on headline contract wins.

Screen & Shortlist

What is this? A scorecard to compare companies side by side on the same six dimensions. Click any score column to sort highest-to-lowest (click again to reverse). Not a formula – just a structured way to keep your analysis consistent.

How companies were selected

Each of the 157 companies was scored using a structured one-pager process backed by latest quarterly filings and earnings releases:

1. **Universe construction.** Up to 10+ names per theme across US, UK, and European exchanges, sourced from industry research and supply-chain analysis. A name enters only with a clear line-of-sight to the theme’s demand driver – not a ticker label or marketing claim.
2. **Six-dimension rubric.** Every row is scored 1–5 on growth momentum, margin quality, balance-sheet strength, competitive durability, tail risks, and valuation. Each score carries a dated, citable evidence point from the latest quarter; there is no undisclosed weighting or black-box scoring.
3. **Shortlist and proposed names.** The shortlist elevates names that pair stronger balance-sheet and durability with controlled tail risk, checked against your theme weights. Higher tail-risk names remain on the watchlist until a full adversarial review is complete; a “top pick” still requires that pack regardless of rubric scores.

The composite total is transparent: Growth + Margins + Balance sheet + Durability + (6 – Tail risks) + Valuation, range 5–30. Tail is inverted so a higher total means stronger fundamentals with lower tail exposure.

Dimension	What the 1-5 scale captures
Growth	Sales and demand trajectory – not a single quarter’s noise. 5 = a durable inflection supported by evidence in filings and guidance.
Margins	How well revenue converts to profit – gross trajectory, operating leverage, and cash conversion. 5 = structural margin lift, not one-off cost cuts.
Balance sheet	Debt, liquidity, and refinancing risk versus cash and earnings power. 5 = net cash or very low leverage with manageable maturities.
Durability	Competitive moat – switching costs, scale, IP, or regulation. 5 = the edge is likely to survive aggressive competition.
Tail risks	Low-probability, high-impact shocks (regulation, concentration, geopolitics, technology shifts). 5 = <i>more</i> serious tail risk – worse for the name. This dimension is inverted in the total.
Valuation	Price versus the fundamental story and peers. 5 = easier to justify; cheap can still be a trap if the business is impaired.
Total	Composite 5-30 : G + M + BS + D + (6 – Tail) + V. Higher total = stronger profile once tail risk is penalised.

PDF rubric (shortlist only): Dimension definitions are in Screen & Shortlist → “How companies were selected”. Shading: Growth-Valuation = 1-5 (greener = stronger); Tail inverted (greener = lower risk). Total = tiered bands. Note column tints flag strong YoY vs clear decline language.

Shortlist rubric: Only the Decide shortlist (15 names) – same set developed in Research and Value. Full universe stays in the HTML dashboard.

Theme	Ticker	Growth 1-5	Margins 1-5	Balance 1-5	Durability 1-5	Tail 1-5	Valuation 1-5	Total 5-30	One-line note
AI infra	NVDA	5	5	4	5	3	3	25	Q1 FY26: \$44.1B rev (+69% YoY); DC \$39.1B (+73%); \$4.5B H20 charge from China export controls; GM 72% ex-charge; Blackwell NVL72 full production.
AI infra	ANET	4	4	4	4	3	3	22	Q1 2026: \$2.71B rev (+35% YoY); AI rev target raised to \$3.5B; OM 48%; 100+ customers 800G; FY guide \$11.5B; supply chain constraints flagged.
AI infra	AMAT	2	4	4	4	3	3	20	Revenue declining -2% YoY; WFE downturn hitting despite strong margins; China exposure.
Energy / grids	VST	5	3	3	3	4	4	22	Q1 2026: Record EBITDA \$1.49B; rev \$5.64B (beat +8%); Meta PPA 2,600MW; Cogentrix 5,500MW; Fitch investment grade upgrade; 98% hedged for 2026.
Energy / grids	NEE	2	3	3	4	3	3	18	Q1 2026: Adj EPS \$1.09 (+10%); record 4GW renewables origination; 33GW backlog; contract repricing +\$20/MWh; reaffirmed 8%+ CAGR through 2035.
Energy / grids	FSLR	4	3	3	3	4	3	20	Q1 2026: \$1.04B rev (+24% YoY); EPS \$3.22 (+65%); GM 47%; \$14.4B backlog (47.9 GW); tariff risk on non-US plants; US at 96% utilization.
Cyber	PANW	4	3	4	4	3	2	20	Q2 FY26: \$2.6B rev (+15%); NGS ARR \$6.3B (+33%); RPO \$16B (+23%); Q3 guide +28-29% rev acceleration; acquiring CyberArk June 2; 30%+ OM.
Cyber	FTNT	3	4	4	4	2	3	20	Q1 2026: \$1.85B rev (+20% YoY); billings \$2.09B (+31%); OM 36%; OT billings +70%; record FCF \$1.01B; raised FY guide; FortiOS 8.0.
Automation	ROK	3	3	4	4	2	3	19	Q2 FY26: \$2.24B rev (+12% YoY); organic +9%; EPS \$3.30 (+32%); warehouse auto +30%; raised FY guide; OM expanded 350bps to 22.5%.
Automation	ETN	3	3	4	4	2	3	19	Q1 2026: \$7.5B rev (+17% YoY); DC orders +240%; \$11B acquisitions (Boyd Thermal); raised organic growth guide to 10%; book-to-bill 1.2.
Health Tech	LLY	5	5	4	4	4	2	24	Q1 2026: \$19.8B rev (+56% YoY); Mounjaro \$8.7B (+125%); Zepbound \$4.16B (+80%); EPS \$8.55; raised FY26 to \$82-85B; Foundayo oral GLP-1 launched.
Health Tech	ISRG	4	4	4	4	3	3	22	Q1 2026: \$2.77B rev (+23% YoY); da Vinci procedures +16%; 431 placements (232 da Vinci 5); installed base 11,395 (+12%); EPS \$2.28.
Quantum	IONQ	5	1	5	3	5	1	14	Q1 2026: \$64.7M rev (755% YoY); FY26 guidance \$260-270M; \$470M RPO; \$3.5B cash; MDA SHIELD contract; 99.99% gate fidelity; still pre-profit.
Quantum	QBTS	2	1	3	2	5	1	14	FY2025: \$24.6M rev (+179% YoY); GM 83%; bookings \$30M+ in Jan 2026 alone; \$884M cash; acquired Quantum Circuits; Q1 2026 due May 12.
Quantum	IBM	2	3	3	4	3	3	18	Q1 2026: \$15.9B rev (+9% YoY); Software +11%; Red Hat OpenShift >\$2B ARR; AI software >\$1.5B (+40%); Z mainframe +51%; Confluent acquired.

Shortlist

Which names advance from screening to detailed analysis, based on rubric scores, theme linkage, and balance of growth vs risk. This is a work queue – not a basket, not position sizes, and not a recommendation to trade.

Not advice. No target weights per ticker. Anything here needs your own filings pass, ISA/SIPP eligibility at your broker, and a full adversarial pack before real money.

Method: Names with stronger balance-sheet and durability scores relative to tail-risk exposure are prioritised. Quantum names remain "theme only" until a full adversarial review is complete. Research time is allocated in proportion to theme weights – more depth on AI and energy than quantum.

Ticker	Company	Theme	~Alloc %	Why this name	Social sentiment Reddit + X directional	Key risk / kill criteria
NVDA	NVIDIA	AI infrastructure	33%	Highest rubric growth + margin scores. Accelerator monopoly with data-centre revenue step-change.	Very bullish. Dominant on r/wallstreetbets and r/stocks. X narrative: "AI leader". High retail ownership and conviction.	Export controls tighten; hyperscaler capex pauses; revenue growth decelerates two quarters running.
AMAT	Applied Materials	AI infrastructure	33%	Diversifies AI exposure into wafer fab equipment. Rubric scores strong on balance sheet and durability.	Moderate. Professional investor focus. Less retail buzz than NVDA. Discussed in r/semiconductors around fab cycle timing.	WFE capex cycle downturn; China export restrictions hit revenue mix; inventory build signals over-ordering.
ANET	Arista Networks	AI infrastructure	33%	Data-centre switching backbone. Growing recognition as essential AI networking layer.	Growing interest. Increasingly tagged as "picks and shovels" AI play on X. Moderate Reddit coverage, mostly bullish.	Hyperscaler customer concentration; competitive pressure from Cisco or white-box alternatives; growth slowdown.
NEE	NextEra Energy	Energy transition	28%	Regulated utility anchor with renewables developer upside. Lower volatility ballast for the sleeve.	Popular among dividend and clean energy investors. Steady positive sentiment on r/dividends. X discussion around rate case outcomes.	Rate case disallowance; rising interest rates compress utility valuations; renewables policy reversal.
VST	Vistra	Energy transition	28%	Merchant / IPP angle on AI power demand. Nuclear fleet adds base-load optionality.	Emerging attention as AI-power-demand play. Strong momentum discussion on X. Reddit interest spiked with data centre power thesis.	Power price collapse in ERCOT; merchant exposure cuts both ways; nuclear regulatory or outage risk.
FSLR	First Solar	Energy transition	28%	Utility-scale thin-film solar. US manufacturing advantage and IRA beneficiary. Rubric flags policy sensitivity.	Polarised. Solar bulls cite IRA tailwinds; bears flag trade war and policy risk. Active on r/solarenergy and clean energy X accounts.	Module pricing collapse; IRA incentive rollback; project pipeline delays exceed two quarters.
PANW	Palo Alto Networks	Cybersecurity	10%	Platform consolidation leader. Transitioning to platformisation increases recurring revenue share.	Generally positive. Institutional favourite, moderate retail following. X discussion centres on billings vs revenue transition.	Platform consolidation execution stalls; renewal or net retention drops two quarters; bundled megacap stacks erode share.
FTNT	Fortinet	Cybersecurity	10%	Appliance + security networking heritage. Strong margins and renewal base. Rubric flags durability.	Moderate. Seen as steady compounder rather than momentum play. Less retail buzz than CRWD or PANW. Positive on r/cybersecurity.	Appliance refresh cycle lengthens; competitive share loss to cloud-native security; billings growth inflects down.
ETN	Eaton	Industrial automation	10%	Electrical + power management with direct data-centre power product exposure. Industrial-to-AI crossover name.	Growing interest as data centre infrastructure play. Institutional-heavy; some Reddit coverage in r/stocks. X discussion links to AI power build-out.	Global industrial downturn; data-centre power capex slows; M&A integration stumbles.

Ticker	Company	Theme	~Alloc %	Why this name	Social sentiment Reddit + X directional	Key risk / kill criteria
ROK	Rockwell Automation	Industrial automation	10%	Factory automation and industrial software. Pairs with ETN for different industrial cycle exposure.	Lower retail interest. Niche industrial automation discussions. Some institutional coverage on X around order book trends.	Elongated destocking cycle; China macro weakness; customer capex deferrals; short-cycle orders miss expectations.
LLY	Eli Lilly	Health Tech	10%	GLP-1 / obesity + oncology pipeline. Technology-driven step-change in healthcare outcomes. Highest rubric score alongside NVDA.	Very high interest. GLP-1 / weight loss narrative dominates r/stocks and X health threads. Strong retail conviction. Frequent media coverage.	Key GLP-1 trial failure or label restriction; payer pushback on pricing; competitive molecule reaches market faster.
ISRG	Intuitive Surgical	Health Tech	10%	Robotic surgery leader with recurring consumables revenue. da Vinci installed base drives durable growth.	Moderate positive. Robotic surgery leader reputation. Discussed in r/medicaldevices and health tech X circles. Less volatile sentiment than pharma names.	Procedure growth slows; competitive robotic systems gain share; regulatory delays on new platform.
IBM	IBM	Quantum / frontier	10%	Quantum exposure inside a large-cap services + mainframe wrapper. Lower risk quantum entry point.	Mixed. Legacy reputation creates scepticism. Quantum announcements spark periodic X interest. Reddit sentiment neutral – "show me the revenue" tone.	Quantum roadmap slips vs competitors; consulting revenue contracts; mainframe cycle weakens without cloud migration pull.
IONQ (theme only)	IonQ	Quantum / frontier	10%	Pure-play trapped-ion quantum. Keep as learning position – rubric tail-risk and valuation typically extreme.	Highly speculative. Quantum hype cycles drive sharp Reddit and X swings. Meme-adjacent; heavy retail activity. Sentiment flips rapidly.	Cash runway below 3 quarters; revenue reclassified from product to grant; science roadmap miss by 12+ months.
QNTA (theme only)	D-Wave Quantum	Quantum / frontier	10%	Annealing + gate model quantum. Similar learning-only status to IONQ – size at zero until full adversarial review.	Speculative. Lower volume than IONQ. Reddit quantum threads mention alongside IONQ. X buzz around annealing use-cases is episodic.	Broken financing; revenue quality deteriorates; competing approaches prove superior; sustained cash burn without milestone progress.

Research

Deep-dive analysis on each shortlisted company

For each proposed name, this section provides a structured stress test: bear case, pre-mortem scenario, rebuttal map, and kill criteria. The goal is to identify what would have to go wrong to invalidate the thesis – before committing capital.

Decide shortlist – research at a glance

Same 15 names as the rubric subset below. Summary matrix, adversarial narrative row per name, then one consolidated bear-bullet vs rebuttal table.

Ticker	Theme	Primary stress	Kill / exit trigger (summary)
NVDA	AI infrastructure	Hyperscaler capex digestion; custom inference silicon; export controls	Two consecutive quarters of declining data-centre revenue
AMAT	AI / WFE	Fab cycle; China restrictions; WFE cyclicalilty	WFE industry spending down over 15% YoY for two consecutive quarters
ANET	AI infrastructure	Top-customer concentration; in-house networking; AI cluster order cadence	Loss of a top-2 customer; gross margin under 58% for two quarters
NEE	Energy / regulated utility	Regulatory lag; storm costs; renewable execution	Allowed ROE trend down two years; major unrecovered storm write-down
VST	Energy / merchant IPP	Power prices; hedging; data-centre contract concentration	Sustained margin compression vs peers; balance-sheet covenant pressure
FSLR	Energy / solar manufacturing	Policy and module pricing; project pipeline gaps	Bookings inflection negative two quarters; major customer default cluster
PANW	Cybersecurity	Platform migration; billings vs revenue; competitive consolidation	Billings growth stalls vs guidance two quarters; major platform churn signal
FTNT	Cybersecurity	OT attach cyclicality; appliance mix; pricing in renewals	Net retention materially below peer median two prints
ETN	Industrial / power management	Capex cycle; integration of acquisitions; datacentre order timing	Organic growth guidance cut twice; segment margin step-down without recovery
ROK	Industrial automation	Factory capex cycle; backlog quality; cyclical orders	Book-to-bill under 1.0 for three quarters; backlog cancellations spike
LLY	Health Tech / pharma	Payer pushback; patent cliff; GLP-1 competition	Key franchise revenue miss vs guidance; major payer exclusion
ISRG	Health Tech / devices	Procedure growth; competitive robotics; capital placement	Procedure growth negative two quarters; major hospital system share loss
IBM	Quantum + services	Quantum still tiny vs core; software growth cadence	Software revenue ex-mainframe deceleration vs plan; free cash flow miss trend
IONQ	Quantum	Valuation vs revenue; dilution; path to scaled QC	Cash runway under four quarters without priced financing; revenue quality shock
QBTS	Quantum	Pre-revenue narrative; dilution; technical milestones vs cash burn	Equity raise over 25% dilution without revenue inflection; partnership churn

Decide shortlist – adversarial narrative

Bear / stress, pre-mortem, and kill criteria in one row per name (theme in the table above). Bear bullets vs rebuttals are in the consolidated table below; this avoids duplicating the narrative column.

Ticker	Bear / stress	Pre-mortem	Kill criteria
NVDA	Capex digestion after hyperscaler buildout; custom TPUs / Trainium / Maia taking inference share where CUDA is weaker; tighter China export rules; top-four cloud customers ~50%+ of DC revenue.	Synchronized cloud capex cut plus custom silicon in inference → growth miss and sharp multiple compression.	Two consecutive quarters of declining data-centre revenue; >20% of inference TAM to custom silicon at one hyperscaler.
AMAT	Fab starts pause; China access ~25-30% of WFE at risk; peer share loss in process steps; WFE orders inherently lumpy (short drawdowns hit the stock).	Cycle peak + tighter China + down-year WFE → orders –20% and multiple compresses.	WFE spending forecast down >15% YoY two quarters; AMAT share loss in 2+ process steps.
ANET	Meta + MS ~40% of revenue; in-house switches at hyperscalers; AI cluster pause hits networking within a quarter; 800G pricing vs Cisco / whitebox.	One hyperscaler in-houses networking → –20%+ revenue with no replacement at scale.	Loss of a top-2 customer; GM below 58% two quarters; 800G share <30% in AI cluster wins.

Ticker	Bear / stress	Pre-mortem	Kill criteria
NEE	Rates higher-for-longer hit development ROIC; regulators disallow major capex recovery; renewables pipeline slips; premium vs peers magnifies misses.	Rates stay high while a rate case disallows a flagship programme → de-rating.	Two consecutive rate-case denials; renewables backlog conversion <70%; dividend cut or growth guide cut.
VST	Merchant power has no price floor; nuclear outages; Texas retail competition; ERCOT / PJM market-design risk.	Gas –40% crushes merchant prices while a nuclear outage removes baseload for a quarter.	Nuclear capacity factor <85% two quarters; contracted revenue <50% of total; reform removes scarcity pricing.
FSLR	IRA change; global module oversupply on ASPs; interconnection queues; Si / perovskite eroding thin-film edge.	IRA manufacturing credit removed + ASPs down ~25% → margin collapse.	IRA mfg credit repealed; ASP down >15% YoY two quarters; backlog < two years' revenue.
PANW	Platformisation cannibalises high-margin SKUs; billings vs revenue noise; Microsoft Security bundled in E5; 50x+ P/E punishes slips.	Platform transition drags 3+ quarters, margins compress, Microsoft wins mid-market on bundle.	Net new ARR down two quarters; platformisation customer count flat; RPO growth <20%.
FTNT	Hardware refresh elongates; ZS / CRWD “appliance is dead” narrative wins budgets; regional spend skew; OT still small mix.	Refresh extends two more quarters, product misses while cloud-native takes greenfield.	Product revenue down three straight quarters; service attach <60%; OT losses to IT-centric vendors.
ETN	Non-DC industrial/resi slows; DC segment stalls; M&A integration / price paid; margin from favourable price/cost reverses.	Macro hits construction/industrial while DC orders plateau → low single-digit growth and multiple compression.	DC orders down two quarters; organic growth <3% two quarters; recent M&A ROIC below WACC.
ROK	Orders swing –20% in downturns; Siemens scale; software attach takes years; premium at 30x+ in trough.	Global industrial capex –25%, software doesn't offset, multiple compresses to peers.	Orders –20% YoY three quarters; software ARR <10%; book-to-bill <0.85 two quarters.
LLY	Payer / government price pressure; Novo / Amgen / oral molecules; capacity binds growth; non-GLP-1 pipeline binary.	Forced ~40% GLP-1 price cut + superior competitor molecule → sharp growth deceleration and de-rating.	>40% mandated price cut without volume offset; competitor wins head-to-head efficacy; capacity slip 12+ months.
ISRG	Hugo / Ottawa at scale; hospital capital budget freeze; procedure saturation; 35x+ leaves no miss room.	Hugo wins three major networks, procedure growth single-digit, multiple –25%.	Procedure growth <10% two quarters; competitive placements >500 cumulative; instrument revenue negative.
IBM	Quantum remains R&D drag for years; consulting slows; Red Hat vs hyperscaler native; low single-digit growth vs rates.	Consulting declines while quantum roadmap slips two years → dead money.	Consulting down three quarters; Red Hat ARR <10%; quantum milestones missed 2+ years.
IONQ	100x+ revenue multiple on still-unprofitable business; \$2B dilution done; true quantum utility 3-5y; Google / IBM / Microsoft / neutral-atom competition.	Revenue misses guide on lumpy government deals; competitor reaches utility first; stock halves.	Runway <3 quarters without financing; revenue reclassified to grant/consulting; fidelity roadmap miss 12+ months.
QBTS	Annealing + gate-model story vs small revenue base; dilution; path to milestones vs burn; partner / booking concentration.	Large raise without revenue step-change; partnerships churn; modality loses vs peers.	Equity raise >25% dilution without revenue inflection; partnership churn; failure to scale bookings post-financing.

Decide shortlist – bear bullet vs rebuttal (all names)

Single table for compact print review; HTML cards keep full bear-case prose and kill criteria.

Ticker	Bear bullet	Rebuttal / accepted risk
AI Infrastructure		
NVDA	Capex pause	Accepted risk – mitigated by sovereign AI and enterprise adoption extending the runway. Size position for a 2-quarter pause.
	Custom silicon	Rebuttal: CUDA ecosystem and training dominance persist. Custom chips win narrow inference but struggle with generality. Monitor share of inference revenue.
	Export controls	Accepted risk – partially offset by compliant product SKUs. Track regulatory commentary quarterly.
	Concentration	Structural – diversification into enterprise and sovereign markets is the mitigation. Watch customer count trends.
AMAT	Fab cycle pause	Rebuttal: Gate-all-around transistors and advanced packaging create new equipment cycles even in a slower node cadence. Services revenue grows with installed base.
	China restrictions	Accepted risk – monitor quarterly geographic revenue mix. Partial offset from re-shored demand in US/EU.
	Competition	AMAT's breadth (deposition, etch, inspection) provides diversification. Monitor share within each process step.
	Cyclicalilty	Structural – position size should account for WFE cyclicalilty. Use book-to-bill as lead indicator.
ANET	Customer concentration	Accepted risk – cloud campus and enterprise diversification is the mitigation. Track customer count growth.
	In-house networking	Rebuttal: Arista's EOS software stack and multi-vendor interop create switching costs. Custom networking is hard at scale.
	AI buildout slowdown	Accepted risk – networking orders are a derivative of compute spend. Size for a pause.
	Pricing pressure	Monitor gross margin quarterly. Arista has historically maintained 60%+ gross margins through transitions.
Energy		
NEE	Interest rates	Accepted risk – utility sector-wide. NEE's regulated earnings provide partial offset vs pure developers.

Ticker	Bear bullet	Rebuttal / accepted risk
	Regulatory disallowance	Monitor rate-case outcomes quarterly. Florida's regulatory environment has been historically constructive.
	Renewables execution	Rebuttal: NEE's scale gives procurement advantage. Backlog conversion rate is the metric to track.
	Premium valuation	Accepted – size position smaller than peers to account for multiple risk.
VST	Power price volatility	Rebuttal: Data-centre PPAs at fixed prices provide growing contracted floor. Track contracted vs merchant mix.
	Nuclear risk	Accepted – operational risk is inherent. Vistra's fleet has strong availability history. Monitor capacity factors.
	Retail competition	Accepted – but retail provides natural hedge to wholesale. Track retail margin and churn.
	Regulatory change	Monitor ERCOT/PJM capacity market reform proposals.
FSLR	Policy reversal	Rebuttal: Bipartisan support for domestic manufacturing. IRA repeal requires legislative action, not executive order. Monitor congressional commentary.
	Module pricing	Accepted risk – tariffs provide buffer. Track quarterly ASP and bookings trends.
	Interconnection queues	Structural – affects all developers. FSLR's backlog provides 2+ years visibility. Monitor backlog conversion.
	Technology shift	Monitor perovskite commercial timelines. Thin-film retains advantages in hot climates and bifacial deployment.
Cybersecurity		
PANW	Platformisation drag	Rebuttal: Module attach and RPO growth show customers are buying more, not less. Track platformisation customer count.
	Billings confusion	Use RPO and ARR as cleaner growth signals. Monitor billings duration trends.
	Microsoft Security	Accepted risk – but enterprises often layer PANW on top of Microsoft. Track win rates vs Microsoft-only deals.
	Valuation	Accepted – size position to tolerate 30%+ drawdown on a miss.
FTNT	Appliance refresh stall	Rebuttal: Refresh cycles create pent-up demand. Service attach rate grows with installed base. Monitor product vs services mix.
	Cloud-native competition	Accepted risk in cloud-first accounts. FTNT's ASIC-based architecture retains edge in throughput-sensitive deployments.
	Geographic risk	Monitor regional revenue breakdown quarterly. US growth is the swing factor.
	OT security nascent	Small but growing. Track OT bookings as a percentage of total.
Automation		
ETN	Industrial cycle turns	Accepted risk – Eaton is a multi-segment industrial. Data-centre and utility provide structural offset. Monitor segment orders.
	Data-centre concentration	Rebuttal: Eaton's electrical products are needed regardless of compute provider. Track data-centre order growth quarterly.
	M&A integration	Monitor acquisition cadence and ROIC on deals vs cost of capital.
	Margin dependence	Track price/cost spread and input cost trends.
ROK	Deep cyclicity	Accepted – size position for 30%+ drawdown in a downturn. Use book-to-bill as lead indicator.
	Siemens competition	Rebuttal: Rockwell's installed base of PLCs creates ecosystem lock-in in North America. Monitor share in discrete automation.
	Software transition	Track software ARR as percentage of total revenue. Inflection point is the key milestone.
	Valuation premium	Accepted – entry timing matters. Prefer buying during order-book troughs, not peaks.
Health Tech		
LLY	Payer pushback	Accepted risk – but volume growth can offset per-unit pricing pressure. Track net price vs volume trends.
	Competition	Rebuttal: Mounjaro/Zepbound efficacy data is best-in-class. Oral formulations are 3-5 years behind. Monitor trial readouts.
	Manufacturing	LLY investing billions in new capacity. Track manufacturing expansion milestones.
	Pipeline dependency	Accepted – diversification is the mitigation. Monitor pipeline catalysts quarterly.
ISRG	Competition	Rebuttal: Da Vinci 5 extends the platform. Surgeon training and hospital infrastructure create 5+ year switching costs. Monitor competitive placements.
	Hospital budgets	Accepted risk – capital budgets are cyclical. Recurring instrument revenue provides growing floor. Track system vs instrument mix.
	Procedure saturation	Rebuttal: New procedure types (thoracic, colorectal, bariatric) expand TAM. Monitor procedure volume growth by category.
	Valuation	Accepted – size for the premium. Buy on procedure growth dips, not peaks.
Quantum		
IBM	Quantum cost centre	Accepted – quantum is optionality, not a core thesis driver. IBM's quantum allocation is small vs total R&D.

Ticker	Bear bullet	Rebuttal / accepted risk
	Core business headwinds	Monitor consulting booking growth and Red Hat ARR quarterly.
	Red Hat integration	Rebuttal: OpenShift has enterprise traction. Hybrid/multi-cloud demand is structural.
	Modest growth	Accepted – IBM is a low-beta, dividend-paying exposure. Size expectations accordingly.
IONQ	Extreme valuation	Accepted – size as speculative. The revenue inflection is real but the multiple remains vulnerable to narrative shifts.
	Dilution	Partially rebutted – \$3.5B cash means no near-term dilution needed. Monitor quarterly burn rate.
	Commercial viability timeline	Stronger rebuttal than before – government contracts (MDA, DARPA) and Cambridge centre provide revenue bridge. 99.99% fidelity is a meaningful milestone.
	Competing approaches	Accepted – trapped-ion is one of several viable paths. Monitor cross-approach error-rate benchmarks.
QBTS	Scale vs narrative	Track revenue and gross margin quarterly; treat as speculative until run-rate proves out vs cash burn.
	Financing / dilution	Monitor pro-forma cash post-raise; map runway vs milestone calendar.
	Modality risk	Accepted – compare customer wins and published benchmarks vs peers quarterly.
	Partnership concentration	Disclose customer concentration in filings; diversify thesis drivers where possible.

Value

Valuation methods, key assumptions, and margin of safety

Four complementary models estimate what each name might be worth. No single model is decisive – the value is in agreement or disagreement across approaches. Forward scenarios project earnings growth and exit multiples. DCF sensitivity tests discount rates and growth assumptions. Historical risk metrics show how volatile each name has been. Monte Carlo simulations run 10,000 random paths to estimate probability distributions.

Forward-multiple scenario model

What is this? A quantitative bull / base / bear framework for each proposed name. For every ticker: take today's trailing earnings (or revenue per share for pre-profit names), grow them at three rates over 3 years, apply an exit multiple, and compare the implied price to today's price. The weighted column blends all three scenarios by probability.

Generated 2026-05-11T14:41:51Z. Not predictions – illustrative scenarios to frame your own research. Verify in filings.

How to read this: CAGR = compound annual growth rate over 3 years. *Exit* = the P/E (or P/S) multiple you think the market will assign at the end of year 3. *Implied* = the share price those inputs produce. Δ = percentage change from today's price. *Weighted* = probability-blended target across all three scenarios.

Ticker	Price	Metric	Current multiple	Bull			Base			Bear			Weighted	
				CAGR	Exit	Implied / Δ	CAGR	Exit	Implied / Δ	CAGR	Exit	Implied / Δ	Target	Δ

Qualitative bull / bear

Ticker	Bull	Bear	Watch
NVDA	AI spend + CUDA depth; inference/networking extend TAM.	Capex digestion; custom silicon; export controls; customer concentration.	DC revenue growth cadence; hyperscaler capex tone.
AMAT	Node complexity + packaging lift WFE; services annuity.	Fab pauses; China mix; WFE cyclicalilty.	WFE industry forecasts; share in critical steps.
ANET	800G / AI cluster networking standard bearer.	Hyperscaler in-house; top-2 customer weight; cluster pause.	Customer count; GM through transitions.
NEE	Regulated base + renewables backlog/PPAs.	Rates; disallowances; renewables execution.	Rate cases; backlog conversion.
VST	Merchant power + nuclear optionality into DC load.	Power price collapse; merchant volatility.	Forward curves; contracted vs merchant mix.
FSLR	US module + IRA/regulatory moat; backlog visibility.	Policy; module ASP; interconnection delays.	IRA stability; backlog/ASP quarterly.
PANW	Platform consolidation; SASE/XSIAM attach.	Platformisation churn; megacap bundles; billings cadence.	NN ARR; platform customer adds.
FTNT	Appliance installed base; OT/security wedge.	Refresh elongation; cloud-native competition.	Product vs service; billings vs rev.
ETN	Electrical + DC power infrastructure multi-year.	Industrial cycle; integration.	DC-related orders; segment margins.
ROK	Reshoring + automation software attach.	Capex down-cycles; Siemens competition.	Orders; book-to-bill.
LLY	GLP-1/obesity TAM; pipeline breadth.	Payers; competition; manufacturing.	Scripts; coverage decisions.
ISRG	Procedures + consumables; da Vinci 5.	Competitive robotics; hospital budgets.	Procedure growth; placements.
IBM	Hybrid cloud + software; quantum option as upside call.	Quantum small vs cap; services growth modest.	Software CC growth; consulting mix.
IONQ	Revenue inflection; cash; gov contracts.	Valuation vs revenue; dilution; path to utility QC.	Guidance vs prints; RPO conversion; burn.
QBTS	Annealing niche + cash runway narrative.	Speculative; sparse scenario/MC pack in this export.	Complete quantitative + adversarial pack before sizing.

Historical risk metrics

What is this? How each name has behaved historically – volatility, drawdown, and market sensitivity. Past behaviour is not a forecast, but it helps size positions and set expectations.

Generated 2026-05-11T21:04:48Z. Not investment advice.

Field	Meaning (2y window)
Beta	Cov(stock,SPY)/Var(SPY); >1.5 = high market sensitivity.
Ann. vol	Std(daily returns)×√252; scale for position sizing.
Max DD	Worst peak-to-trough in window; stress-test holder experience.
1Y return	Trailing price change; context only.
Sharpe	(Ann. return – 4.5% rf) / ann. vol; rough risk-adjusted quality.
SPY corr	Pearson vs SPY daily returns; low = diversifier.

Ticker	Beta	Ann. vol	Max DD	1Y return	Sharpe	SPY corr

DCF sensitivity analysis

What is this? A heatmap: **pick one growth row** (how fast you think earnings or revenue can grow) and **one WACC column** (how high a return you need to own the risk). The cell shows a rough fair value and % vs today's price. **Green vs red** is only "under those two guesses, is the model above or below the market?" – not buy/sell advice.

Generated 2026-05-11T21:04:47Z. Illustrative only. Check the real numbers in filings before you act.

How to read the DCF grids

Axis	What it means
Rows (growth)	Each row is a different 5-year growth path (low at top, high at bottom). Moving down a column holds WACC fixed – if prices swing a lot, the name is growth-sensitive .
Columns (WACC)	Equity hurdle rate 8-12% in 1pp steps. Higher column = pickier → lower fair value for the same growth path. If shifting right flips many cells red, the name is discount-rate sensitive .
Cells	Modelled fair value and % vs spot under that row/column pair. Mostly green vs mostly red is a blunt stress test – not a single "true" price.

These grids change a lot when you nudge growth or WACC—that is deliberate. Use them to learn sensitivity, not to quote one fair value.

NVDA – NVIDIA (current price \$219.44, Fwd EPS 11.29)

Growth \ WACC	8%	9%	10%	11%	12%
8.0%	\$266.76 +22%	\$224.85 +2%	\$194.14 -12%	\$170.69 -22%	\$152.19 -31%
14.8%	\$352.74 +61%	\$296.15 +35%	\$254.72 +16%	\$223.10 +2%	\$198.20 -10%

Monte Carlo distribution

What is this? Instead of three point estimates, this runs 10,000 simulations drawing growth and multiple assumptions from a range. The result is a probability distribution – what share of outcomes land above or below today's price.

Generated 2026-05-11T21:04:46Z. Not investment advice – illustrative simulations only. Verify with primary filings.

Decide

Final recommendation, conviction level, and rationale

What is this? A single view that pulls together every model in this report – rubric scores, forward-multiple scenarios, Monte Carlo simulations, risk metrics, and DCF – to revalidate which proposed names deserve deeper work. Green signals reinforce conviction; red flags prompt caution. No single model is decisive; the value is in agreement (or disagreement) across approaches.

Not a recommendation. This table helps you prioritise your next research steps. Tiers are directional – update them as you complete adversarial reviews and verify filings.

Ticker	Theme	Rubric /30	Scenario model		Monte Carlo			Risk profile		Verdict
			Wtd upside	Wtd price	Median up	P(50%↑)	P(30%↓)	Sharpe	Max DD	
NVDA	AI infra	23	+171%	\$594	+149%	99.5%	0%	1.72	-37%	Tier 1 – Strong across all models. High conviction, but watch for valuation stretch.
LLY	Health Tech	23	+136%	\$2,328	+122%	97.8%	0%	0.74	-34%	Tier 1 – GLP-1 pipeline drives massive scenario upside. Lower beta than tech names. Binary trial risk is the offset.
FSLR	Energy	19	+124%	\$520	+108%	95.6%	0%	1.02	-60%	Tier 1 – Models agree on significant upside. But deep drawdown history demands smaller position sizing.
VST	Energy	18	+52%	\$227	+41%	34.4%	0%	0.13	-49%	Tier 2 – Upside is real but volatile. Low Sharpe flags poor recent risk-adjusted returns despite the AI-power thesis.
ISRG	Health Tech	21	+41%	\$611	+40%	31.3%	0%	-0.81	-31%	Tier 2 – Consistent moderate upside. Negative recent Sharpe is a timing concern – solid fundamentals but bought at elevated levels.
ANET	AI infra	22	+31%	\$183	+27%	13.7%	0%	1.01	-50%	Tier 2 – Moderate upside with decent risk-reward. Deep drawdown history requires position discipline.
NEE	Energy	18	+19%	\$113	+17%	0.4%	0%	1.30	-24%	Tier 2 – Limited upside but excellent risk profile. Lowest beta, shallowest drawdown. Portfolio ballast, not a growth driver.
ETN	Industrial	20	+15%	\$464	+7%	0.1%	0%	0.92	-34%	Tier 1 ↑ – UPGRADED. Q1 2026 breakout: DC orders +240%, \$11B acquisitions, raised organic growth to 10%. The catalyst arrived.
FTNT	Cyber	21	+2%	\$116	-3%	0%	1.5%	0.33	-35%	Tier 2 ↑ – UPGRADED. Q1 2026: billings +31%, OT +70%, record FCF \$1.01B. Firewall refresh cycle confirmed. Platformisation working.
AMAT	AI infra	22	-13%	\$386	-16%	0%	9.1%	3.88	-50%	Tier 3 – Q1 rev -2% but Q2 guide \$7.65B (+9%) signals inflection. CEO expects +20% CY2026. Wait for May 14 Q2 results to confirm.
PANW	Cyber	20	-13%	\$183	-19%	0%	18.5%	0.27	-36%	Tier 3 – Improving. Q3 guide +28-29% rev acceleration could trigger upgrade. Acquiring CyberArk. Wait for June 2 Q3 results.
IBM	Quantum	18	-12%	\$200	-12%	0%	1.8%	-0.41	-29%	Tier 3 – Negative across models. Legacy growth profile limits upside. Quantum optionality is real but small vs market cap. Use as context, not core position.
ROK	Industrial	19	-22%	\$357	-24%	0%	27.3%	1.62	-28%	Tier 2 ↑ – UPGRADED. Q2 FY26: +12% rev, organic +9%, margins +350bps to 22.5%. Warehouse auto +30%. Cyclical recovery confirmed.
IONQ	Quantum	12	-41%	\$33	-45%	0%	77.6%	0.70	-68%	Speculative ↑ – Revenue inflection confirmed (755% YoY, \$3.5B cash, MDA contract). Still extreme risk: 100x+ rev, beta 2.84. Upgraded from watchlist-only to speculative with size discipline.
QBTS	Quantum	12	No scenario data		No MC data			No risk data		Speculative – Insufficient quantitative data. Same profile as IONQ. Learning-only until full quantitative pack is run.

Summary: what the models say together

Per-name reconciliation – mirrors the verdict column in the matrix above.

Tier	Ticker	What the models say together
Tier 1	NVDA	Strong across all models. High conviction, but watch for valuation stretch.
Tier 1	LLY	GLP-1 pipeline drives massive scenario upside. Lower beta than tech names. Binary trial risk is the offset.
Tier 1	FSLR	Models agree on significant upside. But deep drawdown history demands smaller position sizing.
Tier 2	VST	Upside is real but volatile. Low Sharpe flags poor recent risk-adjusted returns despite the AI-power thesis.
Tier 2	ISRG	Consistent moderate upside. Negative recent Sharpe is a timing concern – solid fundamentals but bought at elevated levels.
Tier 2	ANET	Moderate upside with decent risk-reward. Deep drawdown history requires position discipline.
Tier 2	NEE	Limited upside but excellent risk profile. Lowest beta, shallowest drawdown. Portfolio ballast, not a growth driver.
Tier 1 ↑	ETN	UPGRADED. Q1 2026 breakout: DC orders +240%, \$11B acquisitions, raised organic growth to 10%. The catalyst arrived.
Tier 2 ↑	FTNT	UPGRADED. Q1 2026: billings +31%, OT +70%, record FCF \$1.01B. Firewall refresh cycle confirmed. Platformisation working.
Tier 3	AMAT	Q1 rev -2% but Q2 guide \$7.65B (+9%) signals inflection. CEO expects +20% CY2026. Wait for May 14 Q2 results to confirm.
Tier 3	PANW	Improving. Q3 guide +28-29% rev acceleration could trigger upgrade. Acquiring CyberArk. Wait for June 2 Q3 results.
Tier 3	IBM	Negative across models. Legacy growth profile limits upside. Quantum optionality is real but small vs market cap. Use as context, not core position.
Tier 2 ↑	ROK	UPGRADED. Q2 FY26: +12% rev, organic +9%, margins +350bps to 22.5%. Warehouse auto +30%. Cyclical recovery confirmed.
Speculative ↑	IONQ	Revenue inflection confirmed (755% YoY, \$3.5B cash, MDA contract). Still extreme risk: 100x+ rev, beta 2.84. Upgraded from watchlist-only to speculative with size discipline.
Speculative	QBTS	Insufficient quantitative data. Same profile as IONQ. Learning-only until full quantitative pack is run.

Action items from this revalidation

The tables above are a snapshot – value accrues when you **turn disagreements into a calendar** (filings, prints, kill criteria) and when you **size positions** to match how wrong you can afford to be. Below is a concise work plan you can lift into your own research tracker or investment committee prep.

1. **Double down on adversarial depth for Tier 1.** NVDA, LLY, FSLR, and ETN are where the models most often agree – that is exactly where overconfidence hides. Schedule full bear-case refreshers: re-read last two 10-Q risk factors, list three new kill triggers per name, and decide what evidence would *downgrade* them before you add size. The payoff is fewer “surprise” downgrades when sentiment turns.
2. **Calendar the catalyst window (May-June).** AMAT (14 May), QBTS (12 May), and PANW (2 June) are live inflection tests embedded in this pack. Block time the week before each: draft expected metrics vs guidance, pre-position your tier-change rules, and note which model outputs would flip if the print misses. Treating dates as *decision rehearsals* beats reacting to headlines.
3. **Re-run scenarios and Monte Carlo quarterly.** Inputs decay the day after earnings. A standing 90-minute refresh – update CAGRs from guidance, sanity-check multiples vs peers, re-export probabilities – keeps the Decide view honest. If you only do one habit from this report, make it that refresh; it compounds.
4. **Map risk metrics to position caps.** High beta and deep historical drawdown (FSLR, VST, IONQ) mean the same headline “Tier” can feel very different in a risk-off week. Translate Sharpe / max DD into max single-name weight or volatility budget *before* you trade; the models already flagged where path pain is likely.
5. **Revisit ROK and IBM as portfolio design choices.** The reconciliation suggests opportunity cost: ROK may be redundant if you already own ETN for industrial exposure; IBM's quantum upside is real but thin versus market cap. Either build a concrete bull case with new data or free capital for names where the models show cleaner asymmetry – that discipline alone often improves portfolio Sharpe.

Refresh this composite view **after each major earnings cycle** (or sooner if a kill criterion in Research fires). The goal is not to chase tiers – it is to keep your thesis and your sizing in sync with fresh evidence.

Monitor

Ongoing tracking, thesis confirmation, and action triggers

Investment theses need constant testing against new data. In the **interactive HTML dashboard**, this section hosts the chart viewer, watchlist / disqual log, and monitoring-trigger cards – useful for day-to-day tracking. Those widgets are omitted from this PDF; the narrative and model outputs above remain the offline record.

PDF: Open the HTML dashboard for charts, watchlist, disqual log, and monitoring triggers.

AI workflow

Claude supports each stage of the pipeline:

- **Theme research:** AI identifies demand drivers, supply chain nodes, and overlooked names within each theme.
 - **Earnings analysis:** Latest quarterly data pulled via yfinance. AI cross-references against management commentary and flags thesis contradictions.
 - **Adversarial review:** AI generates structured bear cases, pre-mortem scenarios, and kill criteria for each proposed name.
 - **Sentiment scanning:** Directional social signals aggregated from Reddit and X.
-

Appendix: AI Architecture and Data Sources

What powers this platform, where the data comes from, and how to reproduce the analysis

Data sources

yfinance (Python)

Fundamentals: price, market cap, P/E ratios, EPS, revenue, margins, cash flow, analyst targets. Historical price data for risk metrics and Monte Carlo inputs. Free, no API key required. Can be delayed or incorrect – always verify against filings.

TradingView (embedded widget)

Live candlestick charts for visual price action and timing assessment. Loaded client-side via TradingView's public widget API. Requires internet connection.

Reddit and X (directional only)

Social sentiment signals from r/wallstreetbets, r/stocks, r/semiconductors, and X/Twitter finance accounts. Used as a directional input, not a trading signal.

SEC filings (manual reference)

10-K and 10-Q filings for earnings verification, risk factors, segment breakdowns, and management commentary. Not automatically pulled – used to cross-check yfinance data.

Screening methodology

Every company is scored 1–5 on six dimensions: **growth** (revenue trajectory), **margins** (gross and operating margin quality), **balance sheet** (debt vs cash), **durability** (competitive moat strength), **tail risks** (low-probability high-impact threats – higher is worse), and **valuation** (price relative to fundamentals – higher means cheaper). Scores are equal-weighted into a composite total out of 30. The rubric is qualitative and transparent – no hidden weighting or black-box scoring.

Valuation models

Forward-multiple scenario analysis

Takes current earnings, grows them at three rates (bull / base / bear) over 3 years, applies exit multiples, and probability-weights the results.

DCF sensitivity

Discounted cash flow grids testing 5 growth rates against 5 WACC assumptions. Each cell shows the implied share price and percentage difference from current market price.

Historical risk metrics

Two years of daily price data: beta (market sensitivity), annualised volatility, maximum drawdown, Sharpe ratio, and S&P 500 correlation.

Monte Carlo simulation

10,000 random price paths using geometric Brownian motion. Outputs probability of 50%+ gain and 30%+ loss over the projection period.

Claude Code Skills

The AI-powered stages of this pipeline are driven by four specialised skills:

thematic-equity-research

The core skill. Defines the full research pipeline – company one-pagers, social sentiment scanning, and adversarial thesis review packs. Sets pillar taxonomy, operating principles (order matters, separate growth from valuation, evidence ladder, kill criteria), communication style rules, and UK-resident execution checklist.

web-scraping

Powers earnings data extraction via yfinance and social sentiment gathering from Reddit and X. Handles anti-bot patterns, content extraction cascades, and graceful degradation when APIs are unavailable.

investment-advisor

General investment analysis patterns applied to rubric scoring, valuation model selection, and portfolio construction logic. Provides frameworks for risk assessment and position sizing – not personalised advice.

mbb-consultant

Structured problem-solving and strategic frameworks (issue trees, MECE breakdowns, hypothesis-driven analysis) applied to thesis construction, industry analysis, and the adversarial review process.

Guardrails

Every page includes a disclaimer: this is education and research, not personalised investment advice.

No name advances to "proposed" status without a completed adversarial review.

All rubric scores require dated, citable evidence – no subjective scoring without data.

Human-in-the-loop: the platform surfaces analysis, but the investor makes every buy/sell/hold decision.

Data freshness: yfinance data can be delayed or incorrect. Always verify critical numbers in SEC filings before acting.

Stock Deep-Dive

EXAMPLE

PDF: This sheet uses a fixed NVIDIA (NVDA) example, compacted to one page. In the browser, pick any name from the list.

Rubric context, scenario range, risk dashboard, DCF sensitivity, Monte Carlo summary, and adversarial bull/bear/kill – combined on one canvas. Use it as a template you can mirror for any name after you refresh the underlying data.

ADVERSARIAL SUMMARY

BULL CASE

AI compute demand is structural and multi-year. NVIDIA's CUDA ecosystem creates deep lock-in. Data-centre revenue step-change has further legs as enterprise and sovereign AI deployments ramp.

BEAR CASE

Hyperscaler capex slows, export controls tighten further, or custom ASICs (Google TPU, Amazon Trainium) erode GPU share. Valuation compresses if growth decelerates.

KILL CRITERIA

Revenue growth decelerates two quarters running; hyperscaler capex plans are cut; custom silicon captures >20% of training workloads.
